Linear Regression Project

Congratulations! You just got some contract work with an Ecommerce company based in New York City that sells clothing online but they also have in-store style and clothing advice sessions. Customers come in to the store, have sessions/meetings with a personal stylist, then they can go home and order either on a mobile app or website for the clothes they want.

The company is trying to decide whether to focus their efforts on their mobile app experience or their website. They've hired you on contract to help them figure it out! Let's get started!

Just follow the steps below to analyze the customer data (it's fake, don't worry I didn't give you real credit card numbers or emails).

Imports

Import pandas, numpy, matplotlib, and seaborn. Then set %matplotlib inline (You'll import sklearn as you need it.)

```
In [2]: import pandas as pd
        import numpy as np
        import matplotlib.pyplot as plt
        import seaborn as sns
        %matplotlib inline
```

Get the Data

We'll work with the Ecommerce Customers csv file from the company. It has Customer info, suchas Email, Address, and their color Avatar. Then it also has numerical value columns:

- Avg. Session Length: Average session of in-store style advice sessions.
- · Time on App: Average time spent on App in minutes
- Time on Website: Average time spent on Website in minutes
- Length of Membership: How many years the customer has been a member.

Read in the Ecommerce Customers csv file as a DataFrame called customers.

```
In [4]: | customers = pd.read_csv('Ecommerce Customers')
```

Check the head of customers, and check out its info() and describe() methods.

In [10]: customers.head()

Out[10]:

          7
              Yearly Amount Spent
                                                    float64
                                    500 non-null
         dtypes: float64(5), object(3)
         memory usage: 31.4+ KB
```

Exploratory Data Analysis

Let's explore the data!

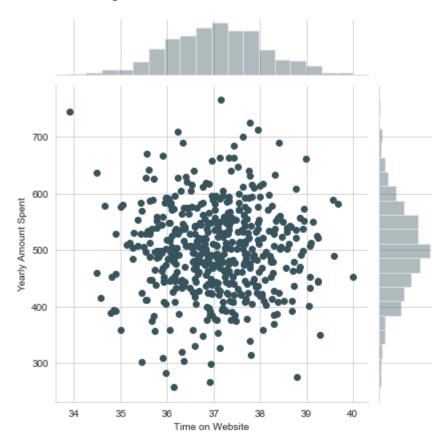

For the rest of the exercise we'll only be using the numerical data of the csv file.

Use seaborn to create a jointplot to compare the Time on Website and Yearly Amount Spent columns. Does the correlation make sense?

```
In [17]: | sns.set_palette("GnBu_d")
          sns.set_style('whitegrid')
```

In [18]: sns.jointplot(x='Time on Website',y='Yearly Amount Spent',data=customers)

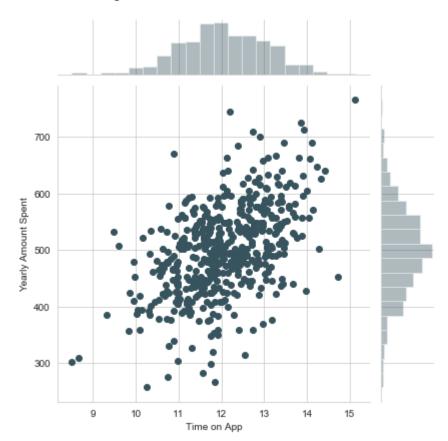

Out[18]: <seaborn.axisgrid.JointGrid at 0x1ff75e78188>

Do the same but with the Time on App column instead.

In [19]: sns.jointplot(x='Time on App',y='Yearly Amount Spent',data=customers)

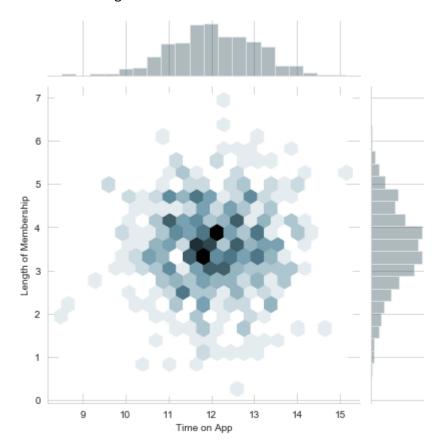

Out[19]: <seaborn.axisgrid.JointGrid at 0x1ff757146c8>

Use jointplot to create a 2D hex bin plot comparing Time on App and Length of Membership.

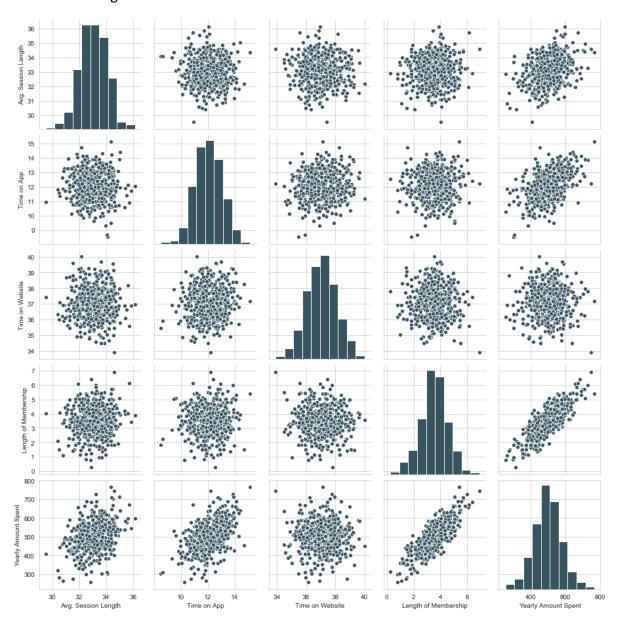

sns.jointplot(x='Time on App',y='Length of Membership',kind='hex',data=custome In [22]:

Out[22]: <seaborn.axisgrid.JointGrid at 0x1ff75d71a88>

Let's explore these types of relationships across the entire data set. Use pairplot (https://stanford.edu/~mwaskom/software/seaborn/tutorial/axis_grids.html#plotting-pairwise-<u>relationships-with-pairgrid-and-pairplot</u>) to recreate the plot below.(Don't worry about the the colors) In [23]: sns.pairplot(customers)

Out[23]: <seaborn.axisgrid.PairGrid at 0x1ff762ab948>

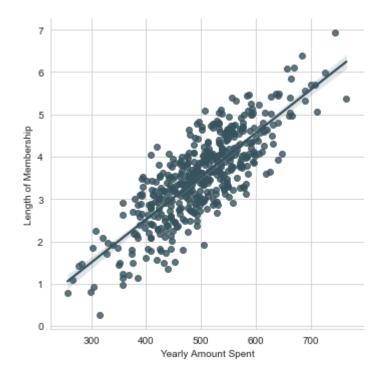

Based off this plot what looks to be the most correlated feature with Yearly Amount Spent?

In [24]: #Lenght of Membership

Create a linear model plot (using seaborn's Implot) of Yearly Amount Spent vs. Length of Membership.

```
In [26]: | sns.lmplot(x='Yearly Amount Spent',y='Length of Membership',data=customers)
Out[26]: <seaborn.axisgrid.FacetGrid at 0x1ff7810f648>
```

Training and Testing Data

Now that we've explored the data a bit, let's go ahead and split the data into training and testing sets. Set a variable X equal to the numerical features of the customers and a variable y equal to the "Yearly Amount Spent" column.

```
In [27]: customers.columns
Out[27]: Index(['Email', 'Address', 'Avatar', 'Avg. Session Length', 'Time on App',
                 Time on Website', 'Length of Membership', 'Yearly Amount Spent'],
               dtype='object')
In [32]:
         X = customers[['Avg. Session Length', 'Time on App',
                 'Time on Website', 'Length of Membership']]
         y = customers['Yearly Amount Spent']
```

Use model_selection.train_test_split from sklearn to split the data into training and testing sets. Set test_size=0.3 and random_state=101

```
In [34]: from sklearn.model_selection import train_test_split
In [37]: X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.3, rando
         m state=101)
```

Training the Model

Now its time to train our model on our training data!

Import LinearRegression from sklearn.linear_model

```
In [38]: from sklearn.linear model import LinearRegression
```

Create an instance of a LinearRegression() model named Im.

```
In [39]: lm = LinearRegression()
```

Train/fit Im on the training data.

```
In [40]: | lm.fit(X_train,y_train)
Out[40]: LinearRegression(copy_X=True, fit_intercept=True, n_jobs=None, normalize=Fals
         e)
```

Print out the coefficients of the model

```
print('The Coefficients are:\n',lm.coef_)
In [43]:
         The Coefficients are:
           [25.98154972 38.59015875 0.19040528 61.27909654]
```

Predicting Test Data

Now that we have fit our model, let's evaluate its performance by predicting off the test values!

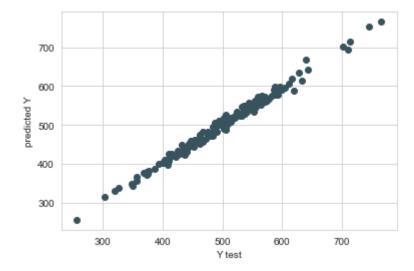

Use Im.predict() to predict off the X_test set of the data.

```
In [44]: predictions=lm.predict(X_test)
```

Create a scatterplot of the real test values versus the predicted values.

```
In [49]:
         plt.scatter(y test,predictions)
         plt.xlabel('Y test')
         plt.ylabel('predicted Y')
```

```
Out[49]: Text(0, 0.5, 'predicted Y')
```

Evaluating the Model

Let's evaluate our model performance by calculating the residual sum of squares and the explained variance score (R^2).

Calculate the Mean Absolute Error, Mean Squared Error, and the Root Mean Squared Error. Refer to the lecture or to Wikipedia for the formulas

```
In [55]:
         from sklearn import metrics
         print('MAE:',metrics.mean_absolute_error(y_test,predictions))
         print('MSE:',metrics.mean_squared_error(y_test,predictions))
         print('RMSE:', np.sqrt(metrics.mean squared error(y test,predictions)))
```

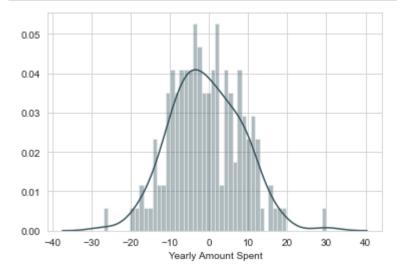

MAE: 7.228148653430817 MSE: 79.81305165097437 RMSE: 8.93381506697863

Residuals

You should have gotten a very good model with a good fit. Let's quickly explore the residuals to make sure everything was okay with our data.

Plot a histogram of the residuals and make sure it looks normally distributed. Use either seaborn distplot, or just plt.hist().

```
In [67]: #plt.hist((y_test-predictions),bins=50);
         #plt.xlabel('Yearly amt spent')
         sns.distplot((y_test-predictions),bins=50);
```

Conclusion

We still want to figure out the answer to the original question, do we focus our efforst on mobile app or website development? Or maybe that doesn't even really matter, and Membership Time is what is really important. Let's see if we can interpret the coefficients at all to get an idea.

Recreate the dataframe below.

```
In [69]:
         coeffecients = pd.DataFrame(lm.coef_,X.columns)
         coeffecients.columns=['Coefficenct']
         coeffecients
```

Out[69]:

	Coefficenct
Avg. Session Length	25.981550
Time on App	38.590159
Time on Website	0.190405
Length of Membership	61.279097

How can you interpret these coefficients?

Interpreting the coefficients:

- · Holding all other features fixed, a 1 unit increase in Avg. Session Length is associated with an increase of 25.98 total dollars spent.
- Holding all other features fixed, a 1 unit increase in Time on App is associated with an increase of 38.59 total dollars spent.
- Holding all other features fixed, a 1 unit increase in Time on Website is associated with an increase of 0.19 total dollars spent.
- Holding all other features fixed, a 1 unit increase in Length of Membership is associated with an increase of 61.27 total dollars spent.

Do you think the company should focus more on their mobile app or on their website?

As there are more customers spending their time on the app company need to develop website better so that website has equal time spending as app or app should be develoed more so to attract more and more customers.
